Port Website Build & SEO Checklist

A step-by-step workflow for building each port website and setting up search tracking.

1. Website Selection & Preparation

Step 1 — Choose a theme
Choose a website theme from a reputable theme/template site. Confirm that it is built with plain HTML and CSS, rather than requiring a framework or CMS.

Step 2 — Prioritize animations
Select a theme with rich animation and motion effects across the site. Check that animations work smoothly and do not make the website difficult to use.

Step 3 — Download the theme with HTTrack
Use HTTrack Website Copier (https://www.httrack.com/page/1/en/index.html) to download the theme for local review

Step 4 — Prepare the required pages
Create these five pages: Home, About, Services(atleast 3 and detail page), Blog (atleast 3 and details page), and Contact. Keep navigation and branding consistent across all pages.

Step 5 — Write the content
Use ChatGPT or Claude to draft page content based on the previous websites we created or new guideline/reference material given. Adapt the text so it is accurate, original, and specific to that port; do not simply copy another website's wording.

Step 6 — Source high-resolution images
Find suitable, high-resolution images using relevant search terms such as the port's name and the type of image needed.

2. On-Page SEO Checklist

- **One H1 per page:** Each page must have exactly one clear, descriptive H1 heading.
- **Image alt text:** Add meaningful alt text to informative images. Use empty alt text (alt="") for purely decorative images.
- **Meta tags:** Add a unique, relevant title tag and meta description to every page, plus appropriate charset and viewport metadata.
- **Canonical URL:** Add a canonical link tag on every page pointing to that page's preferred absolute URL.
- **Tab text:** Set a clear, unique HTML title for each page so the browser tab text describes the page.
- **Favicon and logo:** Add the site logo where appropriate and configure a favicon for every page, using consistent branding.

Before launch, also check mobile responsiveness, working navigation and forms, page speed, broken links, HTTPS, and that search engines can crawl the intended pages.

3. Google & Bing Setup

- **Create a separate Gmail account for each port website:** So the site's ownership and access can be managed independently. Store credentials securely and enable two-step verification.
- **Create YouTube, and few other and use there link check old sites,**
- **Create Google Analytics:** Set up a Google Analytics 4 property for the relevant website and install its Google tag (gtag.js) on all pages, or use Google's recommended installation method. Verify that page views are being recorded.

- **Register in Google Search Console:** Add the domain/property and complete ownership verification, preferably using a supported domain-level verification method.
- **Register in Bing Webmaster Tools:** Add the website and complete verification.
- **Create and submit sitemap.xml:** Generate a sitemap containing the canonical, indexable URLs. Make sure it is accessible at the site's sitemap URL, then submit it in Google Search Console and Bing Webmaster Tools.
